

# Analysis of Car crashes and Metro traffic in NYC

To start exploring the data, I used two plots. One to show the number of entries of 4 stations located in Manhattan. The other is to show the number of car crashes in Manhattan at the same time period.

These plots suggest that the number of daily entries in metro stations may have an impact on the number of car crashes. It appears that when the number of entries rises the number of car crashes decreases. However, metro station entries might not be the only factor that impacts the number of car crashes.
